Note to IFU collective members

Re: **IFU position regarding Codex MRLs for processed and ready-to-eat foods**

Dear Madam/Sir,

Based on the decision taken at IFU Commission for Legislation meeting held on 17th June 2007 in the Hague/Scheveningen you will find again attached the letter sent to Codex Alimentarius with IFU remarks on CL 2006/20-PR “*Request for comments on the establishment of MRLs for processed and ready-to-eat foods*” (see Annex 1).

The IFU put together this statement advocating a distinction between MRLs for ready-to-eat foods (fruit juices, concentrates and other fruit derived products) as follows:

- Fruit juices should have the same MRLs as those for the raw agricultural commodity (fruits).
- Concentrates should have the same MRLs as fruits allowing for the degree of concentration. If the concentration factor is 6, MRL for the concentrated may be max. 6 times higher than the raw agricultural commodity.
- Other fruit derived products (e.g. citrus oil, fruit extracts, dried pulp etc.) should have an adjusted MRL depending on the concentration and the final usage in a consumer product.

We would be grateful if you could contact your Codex representative at national level with the aim to explain the position of the worldwide fruit juice industry on MRLs for processed fruits.

Re: Establishment of MRL'S for processed and ready-to-eat-foods, CL 2006/20-PR

Dear Sirs,

The IFU is representing the worldwide fruit juice industry and is an accepted NGO (Non Governmental Organization) in the Codex Committee for Pesticide Residues and various other CODEX Committees.

First of all we compliment the drafting group consisting of The Netherlands, EC and USA with the preparation of the document CX/PR 06/38/10 which serves as a good basis for the discussion.

Our industry is very internationally oriented and is therefore absolutely interested in a clear, simple and practical guidance in respect to internationally accepted MRL's for the traded products.

Whilst recognising that pesticides are still indispensable in order to protect the agricultural product against defects and/or microbial degradation our industry is in favour of as low as possible pesticide levels in ready to eat food as in general pesticides have a negative connotation in the eyes of the consumer.

INTERNATIONAL FEDERATION OF FRUIT JUICE PRODUCERS

INTERNATIONALE
FRUCHTSAFT-UNION

Tel : +33 (0) 1 47 42 82 80
Fax : + 33 (0) 1 47 42 82 81

Let us, for sake of clarity, first briefly explain that within our industry processed products like fruit juices /purees and concentrated fruit juices/purees and fruit segments are important items in international trade. Furthermore, also processed products like citrus (dried) pulp, citrus peels, citrus oils, fruit aromas and fruit extracts are traded internationally. Partly, these products are intended for direct consumption (juices and purees, fruit segments), others are used as an ingredient and consumed after reconstitution to the original strength (e.g. fruit juices from concentrated fruit juice) or used as an ingredient in other foodstuffs.

The above explanation also indicates that in international trade we have a number of ready-to-eat (or ready-to-drink) items such as, fruit juices, fruit segments and on the other hand processed products which are used as an ingredient in ready to eat products such as, concentrated fruit juices, fruit extracts, citrus oils, etc.

To consider both categories under the term “processed food” with one MRL is to our opinion too simplistic and will easily lead to confusion and unfair treatment of some of the processed products as indicated above.

Therefore we advocate a distinction between:

1. Ready-to-eat food.

Ready-to-eat food (in our case fruit juice) is directly obtained from a Raw Agricultural Commodity (RAC) and intended for direct consumption without further concentration of the pesticide residue level.

In this case, we think the situation for fruits and fruit juices is rather easy. The ready-to-eat food (fruit juice) can not have a higher residue level than what is allowed for the RAC (in our case fruits). This also complies with practice as the residue level in processed fruit juices or segments is always lower than the maximum level of the RAC itself. How much lower depends on the fruit (e.g. thickness of the peel) and processing techniques. It is a fact that during extraction and further processing the residue level will not increase.

INTERNATIONAL FEDERATION OF FRUIT JUICE PRODUCERS

FÉDÉRATION INTERNATIONALE DES
PRODUCTEURS DE JUS DE FRUITS

FRUCHTSAFT-UNION

Tel : +33 (0) 1 47 42 82 80
Fax : + 33 (0) 1 47 42 82 81

Our recommendation,

To adopt as a rule the same MRL's of ready to eat food as those for the RAC for fruit products (juices) intended for direct consumption.

As an exception to the rule one could agree that in special cases a lower MRL can be established if e.g. due to high consumption by certain consumer groups (e.g. children), a health risk would occur.

2. Processed foods not immediately intended for direct consumption.

Here the situation is a bit different.

• In the case of concentrated fruit juices.

In these products the water present in the fruit and consequently in the extracted fruit juice has been evaporated. With this evaporation no reduction of the pesticide residue level occurs and therefore the residue level in the concentrate will be higher than in the fruit juice directly expressed from the RAC. How much higher will depend on the degree of concentration which is usually 5 –6 times. The products are always at least reconstituted (diluted) with water to the original level before consumption or further in cases where the concentrate is used as an ingredient in other food stuffs (e.g. fruit juice containing beverages).

For these products (traded as concentrated fruit juices) it would not be correct to enforce the same MRL's as for the ready-to-eat food (see 1). A MRL of ..x.. times the MRL of the RAC would be therefore acceptable whereby ..x.. stands for the degree of concentration. A practical calculation for this degree of concentration is taking the international used Brix level into account.

Example: a concentrate apple juice of 70 Brix has a concentration factor of 70 /11.5 (Brix for apple juice from concentrate in the CODEX Standard) = 6.08.

So, the MRL in concentrated apple juice may be max. 6.08 higher than in the RAC

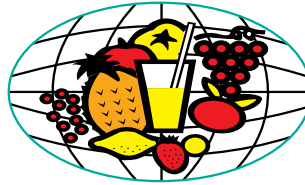

Our recommendation

To take for these products the concentration factor into account.

Fax : + 33 (0) 1 47 42 82 81

- **Other fruit derived products (e.g. citrus oil, fruit extracts, dried pulp etc).**

These products can contain different levels than seen in the fruit or juice due to their processing conditions and drying, i.e. they are produced from specific parts of the fruit or water is removed etc. Due to their low usage, such as orange oil e.g. (0,01%), in the ready to consume products their overall contribution to the consumer product is very low.

As these materials are different from the RAC or the juice derived from it, and as they are not consumed as such, the fruit MRL should not apply here. This logic is also relevant to by-products derived from the fruit, such as dried citrus pulp or apple pomace.

Our recommendation

In these cases either higher MRL's should be established that would be relevant to the pesticide and product in question or a factor be developed that allows for any concentration of the residue that could occur during processing etc. We are more than willing to co-operate in establishing these values or factors.

We hope to have given you not only some food for thought but also some concrete proposals for establishing MRL's for fruit related products.

Please, do not hesitate to contact us in case you need any further information.

Yours sincerely,

International Federation of Fruit Juice Producers
